#### 1. About

DVRPC's IPD analysis identifies populations of interest under Title VI of the Civil Rights Act and the Executive Order on Environmental Justice (#12898) using 2013-2017 American Community Survey (ACS) five-year estimates from the U.S. Census Bureau. IPD analysis assists both DVRPC and outside organizations in equity work by identifying populations of interest, including youth, older adults, female, racial minority, ethnic minority, foreignborn, limited English proficiency, disabled, and low-income populations at the census tract level in DVRPC's nine-county region.

There are many ways of identifying these populations of interest. This document discusses DVRPC's process, which is automated in an R script.

## 1a. Getting started

For guidance on software prerequisites and how to run this script, see getting started.pdf in the documentation folder.

## 1b. Output abbreviations

Components of field names that you'll see in outputs and throughout the script.

```
{r table1, tidy=FALSE} library(tidyverse) data1 <-</pre>
tribble( ~"Component", ~"Equivalent", "D",
                                                      "Disabled", "EM",
"Ethnic Minority", "F",
                                  "Female", "FB",
                                                           "Foreign-
                     "Limited English Proficiency",
Born", "LEP",
                                                     "LI",
"Low-Income", "OA",
                             "Older Adults", "RM"
Minority", "Y",
                          "Youth", "CntEst",
                                                  "Count Estimate",
              "Count MOE", "PctEst",
"CntMOE",
                                          "Percentage Estimate".
              "Percentage MOE", "Pctile",
"PctMOE"
                                               "Percentile", "Score",
"Score", "Class",
                        "Classification" ) knitr::kable((data1),
booktabs = TRUE, caption = 'Component and Equivalent')
```

Abbreviations of field names that you'll see in outputs *not* comprised of the above components.

```
{r table2, tidy=FALSE} library(tidyverse) data2 <-</pre>
tribble( ~"Abbreviation", ~"Equivalent", "GEOID",
                                                            "Census
Tract Identifier", "STATEFP",
                                    "State FIPS Code", "COUNTYFP",
"County FIPS Code", "NAME",
                                      "Census Tract FIPS Code",
                 "Composite IPD Score", "U_TPopEst",
"IPD Score",
Population Estimate", "U_TPopMOE",
                                      "Total Population MOE".
"U Pop5Est",
                 "Population 5+ Estimate", "U Pop5MOE",
"Population 5+ MOE", "U PPovEst",
                                       "Poverty Status Population
Estimate", "U PPovMOE",
                            "Poverty Status Population MOE",
"U_PNICEst",
                 "Non-Institutional Civilian Population Estimate",
"U PNICMOE",
                 "Non-Institutional Civilian Population MOE", )
knitr::kable((data2), booktabs = TRUE, caption = 'Abbreviation and
Equivalent')
```

## 1c. Project structure

This script uses relative file paths based off the location of ipd.Rproj. As long as you download the entire repository, the script should have no trouble locating the correct subfolders. All of the subsequent years files are based on the same architecture. The project is structured as follows:

```
{r file structure, eval = FALSE} ipd ipd.Rproj
                                                 script.R
documentation
                    discussion.pdf
                                         getting started.pdf
                           script reference.Rmd
script reference.pdf
                                                      variables.csv
              breaks by_indicator.csv
outputs
                                            counts by indicator.csv
ipd.csv
              ipd.dbf
                                                        ipd.shx
                            ipd.prj
                                          ipd.shp
                         summary by indicator.csv
mean by county.csv
```

## 2. Setup

## 2a. Dependencies

Packages required to run this script. If you don't have the packages, you'll get the warning Error in library (<name of package>): there is no package called '<name of package>', in which case you'll need to install the package before proceeding.

```
{r packages, message = FALSE} library(plyr); library(here);
library(sf); library(summarytools); library(tidycensus);
library(tidyverse); library(tigris); library(dplyr); library(descr);
```

#### 2b. Fields

The base information we need for IPD analysis are universes, counts, and percentages for nine indicators at the census tract level. For each indicator, the table below shows the indicator name, its abbreviation used in the script, its universe, its count, and its percentage field if applicable. Because the schemata of ACS tables can change with each annual ACS update, these field names are applicable *only* to 2013-2017 ACS Five-Year Estimates.

Some percentage fields are empty. This is okay: we will compute the percentages when they are not directly available from the ACS.

Note that variable B02001\_002 ("Estimate; Total: - White alone") is listed as the count for Racial Minority. This is a mathematical shortcut: otherwise, we would need to add several subfields to compute the same estimate. The desired count is B02001\_001 (Universe) – B02001\_002 ("Estimate; Total: - White alone"). The subtraction is computed after download in Section 5d.i., making a correct estimate and an incorrect MOE. The correct MOE for the count, as calculated in Section 4, will be appended later.

```
{r table1, tidy=FALSE} library(tidyverse) data3 <-
tribble( ~"Indicator", ~"Abbreviation", ~"Universe", ~"Count",
    ~"Percentage", "Disabled", "D", "S1810_C01_001", "S1810_C02_001",
    "S1810_C03_001", "Ethnic Minority", "EM", "B03002_001", "B03002_012",
    "N/A", "Female", "F", "S0101_C01_001", "S0101_C05_001",
    "DP05_0003PE", "Foreign-Born", "FB", "B05012_001", "B05012_003",
    "N/A", "Limited English Proficiency", "LEP", "S1601_C01_001",
    "S1601_C05_001", "S1601_C06_001", "Low-Income", "LI", "S1701_C01_001",
    "S1701_C01_042", "N/A", "Older Adults", "OA" "S0101_C01_001",
    "S0101_C01_030", "S0101_C02_030", "Racial Minority", "RM",
    "B02001_001", "B02001_002", "N/A", "Youth", "Y", "B03002_001",
    "B09001_001", "N/A" ) knitr::kable((data3), booktabs = TRUE, caption =
'')</pre>
```

While it's quicker to embed the names of the desired columns into the code, fields are explicitly spelled out in this script. This is a purposeful design choice. The user should check that the field names point to the correct API request with every IPD update. The best way to check the field names is to visit Census Developers (link) and select the corresponding API. For a history of the ACS variables used in IPD 2015, 2016, and 2017, see variables.csv in the documentation folder.

```
disabled_universe <- "S1810_C01_001"
disabled_count <- "S1810_C02_001"
disabled_percent <- "S1810_C03_001"
```

```
ethnic_minority_universe <- "B03002_001"
ethnic_minority_count <- "B03002_012"
ethnic_minority_percent <- NA
female_universe <- "S0101_C01_001"
female_count <- "S0101_C05_001"
female_percent <- "DP05_0003PE"
foreign_born_universe <- "B05012_001"
foreign_born_count <- "B05012_003"
foreign_born_percent <- NA
limited_english_proficiency_universe <- "S1601_C01_001"
limited_english_proficiency_count <- "S1601_C05_001"
limited_english_proficiency_percent <- "S1601_C06_001"</pre>
low_income_universe <- "S1701_C01_001"
low_income_count <- "S1701_C01_042"
low_income_percent <- NA
older_adults_universe <- "S0101_C01_001"
older_adults_count <- "S0101_C01_030"
older_adults_percent <- "S0101_C02_030"
racial_minority_universe <- "B02001_001"
racial_minority_count <- "B02001_002"
racial_minority_percent <- NA
youth_universe <- "B03002_001"
youth_count <- "B09001_001"
youth_percent <- NA
```

#### 2c. Year

The data download year. {r year} ipd\_year <- 2017

#### 2d. States

The data download state or states. Use the two-character text abbreviation.  $\{r \text{ states}\}\ ipd\_\text{states} <- c("NJ", "PA")$ 

#### 2e. Counties

```
The counties in your study area. Use five-digit characters concatenating the two-digit state and three-digit county FIPS codes. {r counties} ipd_counties <- c("34005", "34007", "34015", "34021", "42017", "42029", "42045", "42091", "42101")
```

#### **2f. Census API Key**

Placeholder if you have never installed an API key before. If this is your first time accessing the Census API using R, see getting\_started.pdf in the documentation folder. {r api\_key} # Census API Key # census\_api\_key("YOUR API KEY GOES HERE", install = TRUE)

# THE TYPICAL USER SHOULD NOT HAVE TO EDIT ANYTHING BELOW THIS POINT.

## 2g. Functions

Load custom functions.

#### 2g.i. Override base and stats function defaults

```
A time-saver so that it's not required to call na.rm = TRUE every time common functions are called. {r override} min <- function(i, ..., na.rm = TRUE) { base::min(i, ..., na.rm = na.rm) } mean <- function(i, ..., na.rm = TRUE) { base::mean(i, ..., na.rm = na.rm) } sd <- function(i, ..., na.rm = TRUE) { stats::sd(i, ..., na.rm = na.rm) } max <- function(i, ..., na.rm = TRUE) { base::max(i, ..., na.rm = na.rm) }
```

#### 2g.ii. Create custom half-standard deviation breaks

For a given vector of numbers x and a number of bins i, st\_dev\_breaks computes the bin breaks starting at  $-0.5 \cdot st \, dev$  and  $0.5 \cdot st \, dev$ . For the purposes of IPD analysis, i = 5, and st\_dev\_breaks calculates the minimum,  $-1.5 \cdot st \, dev$ ,  $-0.5 \cdot st \, dev$ ,  $0.5 \cdot st \, dev$ ,  $1.5 \cdot st \, dev$ , and maximum values. These values are later used to slice the vector into five bins.

#### 2g.iii. Exception

All minima are coerced to equal zero. If the first bin break  $(-1.5 \cdot st \, dev)$  is negative, as happens when the data has a large spread and therefore a large standard deviation, then this bin break is coerced to equal 0.1. In these cases, only estimates of 0 percent will be

```
placed in the bottom bin. {r st dev breaks} st dev breaks <- function(x, i,
na.rm = TRUE) { half st dev count < c(-1 * rev(seq(1, i, by = 2)),
seq(1, i, by = 2))
                      \overline{i}f(\overline{(i \% 2)} == 1) {
                                               half st_dev_breaks <-
sapply(half st dev_count,
                                                               function(i)
(0.5 * i * sd(x)) + mean(x))
                                   half st dev breaks[[1]] <- 0
half st dev breaks[[2]] <- ifelse(half st dev breaks[[2]] < 0,
0.1,
                                              half st dev breaks[[2]])
half st dev breaks[[i + 1]] <- ifelse(max(x) > half st dev breaks[[i +
1]],
                                                  max(x),
half st dev breaks[[i + 1]])
                                 } else {
                                              half st dev breaks <- NA
    return(half st dev breaks) }
```

#### 2g.iv. Move column or vector of columns to last position

The requested schema for IPD data export renames and places all relevant universes in the final columns of the dataset. move\_last moves a column or vector of column names to the last position(s) in a data frame.  $\{r move_last\} move_last <- function(df, last_col) \{ match(c(setdiff(names(df), last_col), last_col), names(df)) \}$ 

#### 2g.v. Summarize data

```
description tailors the exports from summarytools::descr to create summary tables with the requested fields. 0.5 \cdot stdev is returned after stdev. {r description} description <- function(i) { des <- as.numeric(descr(i, na.rm = stats = c("min", "med", "mean", "sd", "max"))) des <- c(des[1:4], des[4] / 2, des[5]) return(des) }
```

## 3. Variance replicate table download

This will feel out of order, but it's necessary. The racial minority indicator is created by summing up several subgroups in ACS Table B03002. This means that the MOE for the count has to be computed. While the ACS has issued guidance on computing the MOE by aggregating subgroups, using the approximation formula can artificially deflate the derived MOE. Variance replicate tables are used instead to account for covariance and compute a more accurate MOE. The MOE computed from variance replicates is substituted in for the racial minority count MOE in Section 5d.ii.

See the Census Bureau's Variance Replicate Tables Documentation (link) for additional guidance on working with variance replicates.

## 3a. Download variance replicates from Census website

Download, unzip, and read variance replicate tables for Table B02001. Results are combined into a single table called var\_rep. {r varrep\_download, tidy = TRUE, message = FALSE} ipd\_states\_numeric <- fips\_codes %>% filter(state %in% ipd\_states) %>% select(state\_code) %>% distinct(.) %>% pull(.) var\_rep <- NULL for (i in 1:length(ipd\_states)){ url <- paste0("https://www2.census.gov/programs-surveys/acs/replicate\_estimat

#### 3b. Combine and format downloads

Subset var\_rep for the study area defined in ipd\_counties and extract the necessary subgroups. {r varrep\_merge, message = FALSE} var\_rep <- var\_rep %>% mutate\_at(vars(GEOID), funs(str\_sub(., 8, 18))) %>% filter(str\_sub(GEOID, 1, 5) %in% ipd\_counties) %>% select(-TBLID, -NAME, -ORDER, -moe, -CME, -SE) %>% filter(TITLE %in% c("Black or African American alone", "American Indian and Alaska Native alone", "Asian alone", "Asian alone", "Native Hawaiian and Other Pacific Islander alone", "Two or more races:"))

## 4. Variance replicate table processing

## 4a. Compute racial minority count MOE

Add up the racial minority counts into a single count per census tract for the estimate and 80 variance replicates. Separate the resulting data frame into estimates and variance replicates. {r varrep\_subset, message = FALSE} num <- var\_rep %>% group\_by(GEOID) %>% summarize\_if(is.numeric, funs(sum)) %>% select(-GEOID) estim <- num %>% select(estimate) individual\_replicate <- num %>% select(-estimate) Compute the variance replicate for the count. GEOIDs are stored as id to be re-appended to the MOEs after they are calculated. {r varrep\_calc, message = FALSE} id <- var\_rep %>% select(GEOID) %>% distinct(.) %>% pull(.) sqdiff\_fun <- function(v, e) (v - e) ^ 2 sqdiff <- mapply(sqdiff\_fun, individual\_replicate, estim) sum\_sqdiff <- rowSums(sqdiff) variance <- 0.05 \* sum\_sqdiff moe <- round(sqrt(variance) \* 1.645, 0)

#### 4b. Save results

Save the racial minority MOE. {r varrep\_save, message = FALSE} rm\_moe <-cbind(id, moe) %>% as\_tibble(.) %>% rename(GEOID10 = id, RM\_CntMOE = moe) %>% mutate\_at(vars(RM\_CntMOE), as.numeric) Here are the first few lines of rm\_moe: {r varrep\_preview} head(rm\_moe)

#### 5. ACS estimates download

#### 5a. Fields

Fields for downloads from the ACS API were discussed in Section 2b.

#### 5b. Download counts and universes from Census API

Download counts and percentages for each of IPD's nine indicators. Note that the download is for all census tracts in ipd states.

Input data for IPD comes from ACS Subject Tables, Detailed Tables, and Data Profiles. While one can request all the fields for Subject Tables in one batch, mixing requests for two or more different types of tables will result in failure. For this reason, the counts and universe fields supplied by the user in Section 2b are evaluated for their contents and split into three batches: s\_counts for Subject Tables, d\_counts for Detailed Tables, and dp\_counts for Data Profiles.

```
The chunk below zips the user-defined calls from the API with the output abbreviations
into a data frame called counts calls and separates the calls into three batches. {r
api counts, message = FALSE} counts <- c(disabled count,
disabled universe,
                                   ethnic minority count,
ethnic minority universe,
                                            female count, female universe,
foreign born count, foreign born universe,
limited english proficiency count,
limited english proficiency universe,
                                                         low income count,
                                     older adults count,
low income universe,
older adults universe,
                                        racial minority count,
racial minority universe,
                                           youth count, youth universe)
counts_ids <- c("D_C", "D_U", "EM_C", "EM_U", "F_C", "F_U", "FB_C", "FB_U", "LEP_C", "LI_U", "LI_C", "LI_U", "OA_C", "OA_U", "RM_C", "RM_U", "Y_C", "Y_U") counts_calls <-
tibble(id = counts ids, api = counts) %>% drop_na(.) s_calls <-
                     filter(str sub(api, 1, 1) == \overline{}S") d_calls <-
counts calls %>%
                     filter(str sub(api, 1, 1) == "B") dp calls <-
counts calls %>%
                      filter(str sub(api, 1, 1) == "D") API calls are made
counts calls %>%
separately for ACS Subject Tables, Detailed Tables, and Data Profiles and appended to
dl counts. Sometimes there are no requests for an ACS table type; in these situations, the
script bypasses a download attempt. Then, information from counts calls is used to
rename the downloads to the appropriate abbreviation. {r api counts calls,
message = FALSE} dl counts <- NULL if(length(s calls$id > 0))
    s counts <- get_acs(geography = "tract",</pre>
                                                output = "wide",
state = ipd states,
year = ipd year,
                                             variables = s calls$api) %>%
select(-NAME)
                  dl counts <- bind cols(dl counts, s counts) }</pre>
if(length(d calls$id > 0)){      d counts <- get acs(geography = "tract",</pre>
                                                output = "wide",
state = ipd states,
year = ipd year,
                                             variables = d calls$api) %>%
                 dl counts <- left join(dl counts, d counts) }</pre>
select(-NAME)
if(length(dp calls$id > 0)){
                                   dp counts <- get acs(geography =</pre>
                                    state = ipd states,
"tract",
output = "wide",
                                              year = ipd year,
variables = dp calls$api) %>%
                                       select(-NAME)
                                                         dl counts <-
left_join(dl_counts, dp_counts) } counts calls$api <-</pre>
str replace(counts calls$api, "E$", "") for(i in
```

#### 5b.i. Exception

The API does not allow redundant downloads, so universes for Older Adults and Youth are duplicated after download. duplicate\_cols identifies duplicate API calls, and combined\_rows serves as a crosswalk to duplicate and rename fields. {r api\_counts\_duplicator} duplicate\_cols <- counts\_calls %>% group\_by(api) %>% filter(n()>1) %>% summarize(orig = id[1], duplicator = id[2]) e\_paste <- function(i) paste0(i, "M") e\_rows <- apply(duplicate\_cols, 2, e\_paste) m\_rows <- apply(duplicate\_cols, 2, m\_paste) combined\_rows <- as\_tibble(rbind(e\_rows, m\_rows)) %>% mutate\_all(as.character) for(i in 1:length(combined\_rows\$api)) { dl\_counts[combined\_rows\$duplicator[i]] <- dl counts[combined\_rows\$orig[i]] }

## 5c. Download percentages from Census API

Download percentage tables that are available for four of IPD's nine indicators. We will compute percentages and their associated MOEs for the rest of the dataset later. The procedure is identical to that described in Section 5b. {r api percs, message = FALSE} percs <- c(disabled percent, ethnic minority percent, female percent, foreign born percent, limited english proficiency percent, low income percent, older adults percent, drop\_na(.) s\_calls <- percs\_calls %>% filter(str sub(api, 1, 1) == "S") d calls <- percs calls %>% filter(str\_sub(api, 1, 1) == "B") dp\_calls <- percs\_calls %>% filter(str\_sub(api, 1, 1) == "D") dl\_percs <- NULL if(length(s calls\$id > 0)){ s percs <- get acs(geography = "tract",</pre> state = ipd states, output = "wide", variables = s calls\$api) %>% year = ipd year,dl percs <- bind cols(dl percs, s percs) }</pre> select(-NAME) if(length(d calls\$id > 0)){ d percs <- get acs(geography = "tract", state = ipd states, output = "wide", year = ipd year,variables = d calls\$api) %>% select(-NAME) dl percs <- left join(dl percs, d percs) }</pre> if(length(dp calls\$id > 0)){ dp percs <- get acs(geography =</pre> "tract", state = ipd states, output = "wide",  $year = ipd_year,$ variables = dp calls\$api) %>% select(-NAME) dl percs <left join(dl percs, dp percs) } percs calls\$api <-</pre>

```
str_replace(percs_calls$api, "PE", "") names(dl_percs) <-
str_replace(names(dl_percs), "PE", "E") names(dl_percs) <-
str_replace(names(dl_percs), "PM", "M") for(i in
1:length(percs_calls$id)){ names(dl_percs) <-
str_replace(names(dl_percs),
percs_calls$api[i],
percs_calls$id[i]) } dl_percs <- dl_percs %>% rename(GEOID10 =
GEOID)
```

#### 5d. Format downloads

Subset dl\_counts and dl\_percs for DVRPC's nine-county region. Percentages should range from 0 to 100. {r dl\_counts\_dl\_percs, message = FALSE} dl\_counts <-dl\_counts %>% filter(str\_sub(GE0ID10, 1, 5) %in% ipd\_counties) dl\_percs <- dl\_percs %>% filter(str\_sub(GE0ID10, 1, 5) %in% ipd counties)

#### 5d.i. Exception

Note that variable B02001\_002 ("Estimate; Total: - White alone") was downloaded as the count for racial minority. Compute B02001\_001 (Universe) - B02001\_002 ("Estimate; Total: - White alone") and substitute for RM\_CE. {r perc\_excp\_1, message = FALSE} dl\_counts <- dl\_counts %>% mutate(x = RM\_UE - RM\_CE) %>% select(-RM\_CE) %>% rename(RM\_CE = x)

#### 5d.ii. Exception

Before computing percentages and percentage MOEs, import the count MOE for the racial minority variable computed from variance replicates. If rm\_moe exists, then this chunk will substitute the correct count MOE in dl\_counts; if not, this chunk will do nothing. {r perc\_excp\_2, message = FALSE} if(exists("rm\_moe")){ dl\_counts <-dl\_counts %>% select(-RM\_CM) %>% left\_join(., rm\_moe) %>% rename(RM CM = RM CntMOE) %>% mutate at(vars(RM CM), as.numeric) }

#### 5d.iii. Exception

Half-standard deviations serve as the classification bins for IPD scores, and including zero-population tracts affects computed standard deviation values. Start by removing the 11 census tracts with zero population. {r perc\_excp\_3} slicer <- c("34005981802","34005982200","34021980000","42017980000", "42045980300","42045980300","42091980100", "42091980000","42091980200","42101036901", "42101980001","42101980002","42101980003","42101980300", "42101980701","42101980702","42101980800","42101980100", "42101980200", "42101980900", "4210198000", "4210198000", "4210198000", "4210198000", "4210198000", "4210198000", "4210198000", "4210198000", "4210198000", "4210198000", "4210198000", "4210198000", "4210198000", "4210198000",

are the first few lines of dl counts and dl percs. Notice the naming convention:

- UE = universe estimate
- UM = universe MOE
- CE = count estimate
- CM = count MOE
- PE = percentage estimate
- PM = percentage MOE

We use these strings to select columns, so consistency is key. {r acs\_preview} head(dl\_counts) head(dl\_percs)

#### 6. ACS estimates calculations

For all nine indicators, this section computes:

- a. Percentages and percentage MOEs
- b. Percentile
- c. IPD score and classification
- d. Composite IPD score

Split dl\_counts into a list named comp for processing and arrange column names in alphabetical order. The name of the list, comp, is a nod to the "component parts" of dl\_counts. The structure of comp is similar to a four-tab Excel spreadsheet: for example, comp is the name of the .xlsx file, uni\_est is a tab for universe estimates, and uni\_est has nine columns and 1,368 rows, where the column is the IPD indicator and the row is the census tract observation.

The order of columns is important because processing is based on vector position. We want to make sure that the first column of every tab corresponds to the Disabled indicator, the second to Ethnic Minority, et cetera. {r comp} comp <- list() comp\$uni\_est <- dl\_counts %>% select(ends\_with("UE")) %>% select(sort(current\_vars())) comp\$uni\_moe <- dl\_counts %>% select(ends\_with("UM")) %>% select(sort(current\_vars())) comp\$count\_est <- dl\_counts %>% select(ends\_with("CE")) %>% select(sort(current\_vars())) comp\$count\_moe <- dl\_counts %>% select(ends\_with("CM")) %>% select(sort(current\_vars()))

## 6a. Percentages and percentage MOEs

#### 6a.i. Calculation

MOEs of the percentage values are obtained using the tidycensus function moe\_prop. This chunk mentions r and c several times: continuing the spreadsheet analogy, think of r as the row number and c as the column number for a given spreadsheet tab. {r perc} pct\_matrix <- NULL pct\_moe\_matrix <- NULL for (c in 1:length(comp\$uni\_est)){ pct <- unlist(comp\$count\_est[,c] / comp\$uni\_est[,c]) pct\_matrix <- cbind(pct\_matrix, pct) moe <- NULL for (r in 1:length(comp\$uni\_est\$LI\_UE)){ moe\_indiv <-

#### 6a.ii. Result

pct and pct\_moe stores the percentages and associated MOEs for the nine indicator
variables. Results are rounded to the tenths place and range from 0 to 100. {r perc\_res,
warning = FALSE} pct <- as\_tibble(pct\_matrix) %>% mutate\_all(funs(. \*
100)) %>% mutate\_all(round, 1) names(pct) <str\_replace(names(comp\$uni\_est), "\_UE", "\_PctEst") pct\_moe <as\_tibble(pct\_moe\_matrix) %>% mutate\_all(funs(. \* 100)) %>%
mutate\_all(round, 1) names(pct\_moe) <str\_replace(names(comp\$uni\_est), "\_UE", "\_PctMOE")</pre>

#### 6a.iii. Exception

If the percentage MOE equals 0, then overwrite it to equal 0.1. This should be a rare occurence with survey data at the census tract level.  $\{r \ perc\_excp\_4\} \ pct\_moe <-pct\_moe %>% replace(., . == 0, 0.1)$ 

#### 6a.iv. Exception

Substitute percentages and associated MOEs when available. This applies to the older adults, female, limited English proficiency, and disabled variables. {r perc\_excp\_5} pct <- pct %>% mutate(D\_PctEst = dl\_percs\$D\_PE, OA\_PctEst = dl\_percs\$0A\_PE, LEP\_PctEst = dl\_percs\$LEP\_PE, F\_PctEst = dl\_percs\$F\_PE) pct\_moe <- pct\_moe %>% mutate(D\_PctMOE = dl\_percs\$D\_PM, OA\_PctMOE = dl\_percs\$OA\_PM, LEP\_PctMOE = dl\_percs\$LEP\_PM, F\_PctMOE = dl\_percs\$F\_PM) Here are the first few lines of pct and pct\_moe: {r pct\_preview} head(pct) head(pct\_moe)

#### 6b. Percentile

#### 6b.i. Calculation

Add percentiles (an additional "spreadsheet tab") to comp, making sure to first sort column names alphabetically. Compute the empirical cumulative distribution function for each of the nine indicator variables. The ECDF can range from 0 to 1, where 1 indicates the largest observed percentage. {r percentile} comp\$pct\_est <- pct %>% select(sort(current\_vars())) percentile\_matrix <- NULL for (c in 1:length(comp\$uni\_est)){ p <- unlist(comp\$pct\_est[,c]) rank <- ecdf(p)(p) percentile matrix <- cbind(percentile matrix, rank) }

#### 6b.ii. Result

percentile stores the percentile for the nine indicator variables. Results are rounded to
the hundredths place. {r percentile\_res, warning = FALSE} percentile <as\_tibble(percentile\_matrix) %>% mutate\_all(round, 2)
names(percentile) <- str\_replace(names(comp\$uni\_est), "\_UE",
"\_Pctile") Here are the first few lines of percentile: {r percentile\_preview}
head(percentile)</pre>

#### 6c. IPD score and classification

Each observation is assigned an IPD score for each indicator. The IPD score for an individual indicator can range from 0 to 4, which corresponds to the following classification and bin breaks:

```
{r table4, tidy=FALSE} library(tidyverse) data4 <- tribble( ~"IPD Score", ~"IPD Classification", ~"Standard Deviations", "0", "Well Below Average", "x $< -1.5 \cdot stdev$", "1", "Below Average", "$-1.5 \cdot stdev \leq$ x $<-0.5 \cdot stdev$", "2", "Average", "$-0.5 \cdot stdev \leq$ x $<0.5 \cdot stdev$", "3", "Above Average", "$0.5 \cdot stdev \leq$ x $<1.5 \cdot stdev$", "4", "Well Above Average", "x $\geq 1.5 \cdot stdev$" ) knitr::kable((data4), booktabs = TRUE, caption = '')
```

#### 6c.i. Calculation

The function st dev breaks is called to compute the bin breaks for each indicator. These breaks determine the IPD score stored in score. Note that we divide rounded PctEst columns by unrounded half-standard deviation breaks to compute the score. class is a textual explanation of the IPD score. {r score class} score matrix <- NULL class matrix <- NULL for (c in 1:length(comp\$uni est)){</pre> unlist(comp\$pct est[,c]) breaks <- st dev breaks(p, 5, na.rm = TRUE)</pre> score <- case when(p < breaks[2] ~ 0, p >= breaks[2] &  $p < breaks[3] \sim 1$ ,  $p \ge breaks[3] \& p$ p >= breaks[4] & p < breaks[5] ~< breaks[4]  $\sim$  2, 3, p >= breaks[5] ~ 4) class <- case when(score == 0 ~ "Well Below Average", score == 1 ~ "Below score == 2 ~ "Average", Average", score == 3 ~ "Above Average", score == 4 ~ "Well Above Average") score matrix <- cbind(score matrix, score)</pre> class matrix <- cbind(class matrix, class) }</pre>

#### 6c.ii. Result

```
score and class store the IPD scores and associated descriptions for the nine indicator
variables. {r score_class_res, warning = FALSE} score <-
as_tibble(score_matrix) names(score) <-
str_replace(names(comp$uni_est), "_UE", "_Score") class <-
as_tibble(class_matrix) names(class) <-</pre>
```

str\_replace(names(comp\$uni\_est), "\_UE", "\_Class") Here are the first few lines
of score and class: {r score\_preview} head(score) head(class)

#### 6d. Composite IPD score

#### 6d.i. Calculation

Sum the IPD scores for the nine indicator variables to determine the composite IPD score. {r ipd\_score} score <- score %>% mutate(IPD\_Score = rowSums(.))

#### 6d.ii. Result

Here are the first few records of the composite IPD score: {r ipd\_score\_preview} head(score\$IPD Score)

## 7. ACS estimates cleaning

There is a specific output format for ipd.csv, including column names, column order, flags for missing data, and census tracts with insufficient data. This section ensures conformity with the output formatting.

```
Merge the percentage estimates, percentage MOEs, percentile, score, and class data frames
into a single data frame called ipd. {r merge} ipd <- bind cols(dl counts, pct)
%>%
       bind cols(., pct moe) %>%
                                        bind cols(., percentile) %>%
bind_cols(., score) %>% bind_cols(., class) Rename columns. {r rename}
names(ipd) <- str_replace(names(ipd), "_CE", "_CntEst") names(ipd) <-</pre>
str_replace(names(ipd), "_CM", "_CntMOE") ipd <- ipd %>%
mutate(STATEFP10 = str sub(GE0ID10, 1, 2),
COUNTYFP10 = str sub(GEOID10, 3, 5),
                                                                     NAME10 =
str sub(GEOID10, 6, 11),
                                                       U TPopEst = F UE,
U_TPopMOE = FUM,
                                               U Pop5Est = LEP UE,
U Pop5M0E = LEP UM,
                                                 U PPovEst = L\overline{I} UE,
U PPovMOE = LI UM,
                                                U PNICEst = D UE,
U PNICMOE = D UM) %>% select(-ends_with("UE"), -ends_with("UM"))
Reorder columns, with GEOID and FIPS codes first, the following variables in alphabetical
order, and the total IPD score and universes at the end. {r reorder} ipd <- ipd %>%
select(GE0ID10, STATEFP10, COUNTYFP10, NAME10, sort(current vars()))
%>% select(move_last(., c("IPD_Score", "U_TPopEst", "U_TPopMOE", "U_Pop5Est", "U_Pop5MOE", "U_PPovEst",
"U PPovMOE", "U PNICEst", "U PNICMOE"))) At the beginning of processing, we
removed 11 census tracts from processing because their populations were equal to zero.
Tack these back on to the dataset. {r tack} slicer <- enframe(slicer, name =
NULL, value = "GEOID10") ipd <- plyr::rbind.fill(ipd, slicer) Replace NA
values with NoData if character and -99999 if numeric. {r replace} ipd <- ipd %>%
mutate if(is.character, funs(ifelse(is.na(.), "NoData", .))) %>%
mutate if(is.numeric, funs(ifelse(is.na(.), -99999, .)))
```

## 8. Summary Tables

This section generates a handful of other deliverables, including:

- a. Counts by indicator
- b. Breaks by indicator
- c. Summary by indicator
- d. County means by indicator

Replace -99999 with NA for numeric columns to avoid distorting summary statistics. {r summary\_prep} ipd\_summary <- ipd ipd\_summary[ipd\_summary == -99999] <- NA

## 8a. Counts by indicator

```
The number of census tracts that fall in each bin. Count census tracts by indicator and bin.
Reorder factor levels so that "Well Below Average" appears before "Below Average," and
the like. {r summary counts, message = FALSE, warning = FALSE} counts <-
ipd summary %>% select(ends with("Class")) export counts <-</pre>
apply(counts, 2, function(i) plyr::count(i)) for(i in
1:length(export counts)){
                              export counts[[i]]$var <-</pre>
names(export counts)[i] } export counts <- map dfr(export counts, `[`,</pre>
c("var", "x", "freq")) colnames(export_counts) <- c("Variable",</pre>
"Classification", "Count") export counts$Classification <-
factor(export counts$Classification,
levels = c("Well Below Average",
"Below Average",
"Average",
                                                                  "Above
                                                                 "Well
Average",
Above Average",
"NoData")) export counts <- arrange(export counts, Variable,
Classification) export counts <- export counts %>%
spread(Classification, Count) %>%
                                     mutate all(funs(replace na(., 0)))
%>%
      mutate(TOTAL = rowSums(.[2:7], na.rm = TRUE))
```

## 8b. Breaks by indicator

The bin breaks for each indicator. Apply the st\_dev\_breaks function to all percentage values and export results. {r summary\_breaks} breaks <- ipd\_summary %>% select(ends\_with("PctEst")) export\_breaks <- round(mapply(st\_dev\_breaks, x = breaks, i = 5, na.rm = TRUE), digits = 3) export\_breaks <- as\_tibble(export\_breaks) %>% mutate(Class = c("Min", "1", "2", "3", "4", "Max")) %>% select(Class, current\_vars())

## **8c. Summary by indicator**

```
Summary statistics of each indicator. Round results to two decimal places. {r summary_summary} pcts <- ipd_summary %>% select(ends_with("PctEst"))
```

```
summary_data <- apply(pcts, 2, description) export_summary <-
as_tibble(summary_data) %>% mutate_all(round, 2) %>%
mutate(Statistic = c("Minimum", "Median", "Mean", "SD", "Half-SD",
"Maximum")) %>% select(Statistic, current vars())
```

## 8d. County means by indicator

Population-weighted means by county and indicator. For the most accurate percentage values, aggregate all counts back to the county level and compute percentages. In the export file, counties are referred to by the five-digit character supplied by the user to ipd counties. {r summary county, warning = FALSE, message = FALSE} export means <- dl counts %>% select(GEOID10, ends\_with("UE"), ends with("CE")) %>% select(GEOID10, sort(current vars())) %>% mutate(County = str sub(GEOID10, 1, 5)) %>% select(-GEOID10) %>% aroup bv(Countv) %>% summarize(D PctEst = sum(D CE) / sum(D UE), EM PctEst = sum(EM CE) / sum(EM UE),F PctEst = sum(F CE) / sum(F UE), FB PctEst = sum(FB CE) / LEP PctEst = sum(LEP CE) / sum(LEP\_UE), sum(FB UE),  $LI PctEst = sum(LI_CE) / sum(LI_UE),$ OA PctEst = sum(OA CE) / sum(OA\_UE), RM PctEst = sum(RM CE) /Y PctEst =  $sum(\overline{Y}_CE) / sum(Y_UE)) %>%$ sum(RM UE), mutate if(is.numeric, funs(. \* 100)) %>% mutate if(is.numeric, round, 1)

## 9. Export

## 9a. Append to TIGER/LINE file

## 9b. Export files

```
Results are saved in outputs. {r happy_trails, message = FALSE, warning = FALSE} st_write(trct, here("outputs", "ipd.shp"), delete_dsn = TRUE, quiet = TRUE) write_csv(ipd, here("outputs", "ipd.csv")) write_csv(export_counts, here("outputs", "counts_by_indicator.csv")) write_csv(export_breaks, here("outputs", "breaks_by_indicator.csv")) write_csv(export_summary, here("outputs", "summary_by_indicator.csv")) write_csv(export_means, here("outputs", "mean_by_county.csv"))
```
